GENERAL

Definition of signal words 1.1

<u>^</u>	DANGER	Hazardous situations which, if not avoided, will result in death or serious injury
	WARNING	Hazardous situations which, if not avoided, could result in death or serious injury
	NOTICE	Property damage message or malfunction
i	Note	Additional information
-	Tip	Recommended action

Purpose of this manual 1.2

The Safety Manual SH 01 contains information relevant for the use of the BR 01a and BR 01b Globe Valve in safety-instrumented systems according to IEC 61508 and IEC 61511.

The safety manual is intended for planners, constructors, and operators of safety-instrumented systems.

Risk of malfunction due to incorrect installation or start-up of the device.

Refer to the respective mounting and operating instructions on how to install and start-up the device.

Observe the warnings and safety instructions written in the mounting and operating instructions.

Further documentation 1.3

The documents listed below contain descriptions of the start-up, functioning and operation of the valve. You can download these documents from the PFEIFFER website.

Globe Valves

Data sheet BR 01a

▶ TB 01a

Data sheet BR 01b

► TB 01b

Maintenance and assembly instructions BR 01a

▶ EB 01a

Maintenance and assembly instructions BR 01b

Functional safety of globe valves, rotary plug valves, ball valves and butterfly valves

► WA 236

In addition to the valve documentation, observe the documentation for the actuator and valve accessories.

2. SCOPE

2.1 General

The PFEIFFER BR 01a / BR 01b Globe Valve in combination with an actuator (e.g. Type 3271 or Type 3277 Pneumatic Actuator) is designed to regulate the flow rate, pressure or temperature of liquids, gases or vapors.

2.2 Use in safety-instrumented systems

The valve can be used in safety-instrumented systems according to IEC 61508 and IEC 61511. The valve can be used in safety-instrumented systems up to SIL 2 (single device) and SIL 3 (redundant configuration) on observing the requirements of IEC 61508.

The safety-instrumented function of the valve is to be regarded as a Type A element in accordance with IEC 61508-2.

The architecture and the interval between proof tests must be considered concerning the safety integrity level.

Through the use of a positioner with diagnostic features on the control valve, the diagnostic coverage can be increased, and, as a result, the probability of failure on demand reduced.

2.3 Versions and ordering data

Valve combined with actuators with travel stop and/or handwheel are not suitable for use in safety-instrumented systems. All other versions are suitable for use in safety-instrumented systems.

2.4 Mounting

The valve and actuator are normally delivered already assembled by PFEIFFER.

3. TECHNICAL DATA

Table 1: DIN version

Туре		01a 01b			
Nominal size		DN 25 to 200	DN 15 to 150		
Nominal pressure	е	PN 10/16			
Material		EN-JS 1049 (GGG40.3)			
Type of connection	on	DIN EN 1092-2, Form B (Form D on request)			
Seat-plug seal		Soft seal · Metal seal · Ceramics (only BR 01a)			
Characteristic		Equal percentage · Linear			
Rangeability		20:1 (to kvs 0.1) · 50:1 (from kvs 0.25) 30:1 (from DN 80)

4. SAFETY-RELATED FUNCTIONS

4.1 Safety-related fail-safe action

The valve, in combination with a pneumatic actuator, controls the process medium flowing through it. When the signal pressure acting on the actuator is changed, the springs in the actuator move the actuator stem downward or upward to close or open the valve. The fail-safe action is triggered when no signal pressure is applied to the actuator.

4.2 Fail-safe action

The signal pressure is normally applied to the actuator. The actuator is vented upon demand of the safety-instrumented function. As soon as the actuator is vented (signal pressure = atmospheric pressure), the spring forces cause the actuator stem to move to the fail-safe position. The valve is completely open or completely closed.

Depending on the actuator's direction of action (see the associated actuator documentation), the valve has one of the following fail-safe positions:

- ⇒ "Actuator stem extends FC" fail-safe action: in the event of emergency, the springs move the actuator stem downward and close the valve [FC = Fail Close].
- ⇒ "Actuator stem retracts FO" fail-safe action: in the event of emergency, the springs move the actuator stem upward and open the valve [FO = Fail Open].

4.3 Protection against unauthorized changes to the configuration

The valve's fail-safe position depends on the mounted actuator's direction of action. The actuator's direction of action can be reversed. However, this is not possible while the process is running.

5 INSTALLATION AND START-UP

The valve is delivered ready to install and can be installed into the pipeline without the need for any additional installation work. Refer to the valve documentation on how to install and start-up the valve.

PFEIFFER recommend checking the installation and start-up using a checklist. Examples of such checklists are included in VDI 2180-5 and the SAMSON brochure WA 236 (Functional safety of globe valves, rotary plug valves, ball valves and butterfly valves).

6. REQUIRED CONDITIONS

Risk of malfunction due to incorrect selection or wrong installation and operating conditions. Only use valves in safety-instrumented systems after the necessary conditions in the plant have been fulfilled.

PFEIFFER recommend checking the necessary conditions using a checklist. Examples of such checklists are included in VDI 2180-5 and the SAMSON brochure WA 236 (Functional safety of globe valves, rotary plug valves, ball valves and butterfly valves).

6.1 Selection

- The suitability of the entire control valve assembly (valve, actuator, valve accessories) for the intended use (pressure, temperature) has been checked.
- ⇒ The valve materials are suitable for the process medium.
- The design of the valve is suitable for the required leak rate and for the indicated switching cycles.
- ⇒ The actuator is correctly sized based on the required transit time and thrust.

6.2 Mechanical and pneumatic installation

- The valve is installed properly into the pipeline as described in the mounting and operating instructions and the actuator mounted on it. Valve accessories are mounted correctly.
- ⇒ The prescribed direction of flow is observed. The arrow on the valve indicates the direction of flow.
- ⇒ The control valve is configured with the correct fail-safe position (FC or FO).
- ⇒ The tightening torques (e.g. for the flanged joints) are observed, see the mounting and operating instructions ➤ EB 01a or ➤ EB 01b.
- ⇒ A strainer must be installed when the process medium contains solids which could block the valve.

The flow of the process medium is blocked by the strainer for a valve with "actuator stem retracts" fail-safe action. Valves with "actuator stem retracts" fail-safe action must not be fitted with a strainer.

6.3 Operation

- ⇒ The plug stem is not blocked.
- ⇒ The medium flow through the valve is not blocked.
- ⇒ The valve is only used in applications that meet the specifications used for sizing at the ordering stage.

6.4 Maintenance

- ⇒ Maintenance is only performed by fully trained, qualified operating personnel.
- ⇒ Only original parts are used for spare parts.
- Adminterance is performed as described in the section on servicing or maintenance in the associated valve documentation.

Contact PFEIFFER concerning any work not described in the section on servicing or maintenance in the associated valve documentation.

7. PROOF TESTING

The proof test interval and the extent of testing lie within the operator's responsibility. The operator must draw up a test plan, in which the proof tests and the interval between them are specified. We recommend summarizing the requirements of the proof test in a checklist.

WARNING

Risk of dangerous failure due to malfunction in the event of emergency (valve does not move to the fail-safe position). Only use devices in safety-instrumented systems that have passed the proof test according to the test plan drawn up by the operator.

Malfunction due to a non-observance of the required inspection requirements.

To test the fail-safe action properly, the following requirements must be met:

- Valve and actuator are assembled together properly.
- The control valve is installed properly into the plant.

Regularly check the safety-instrumented function of the entire SIS loop. The test intervals are determined, for example on calculating each single SIS loop in a plant (PFDavg).

PFEIFFER recommend performing the proof tests based on a checklist. An example of such a checklist is included in the SAMSON brochure WA 236 (Functional safety of globe valves, rotary plug valves, ball valves and butterfly valves).

VISUAL INSPECTION TO AVOID SYSTEMATIC FAILURE

To avoid systematic failure, inspect the valve regularly. The frequency and the scope of the inspection lie within the operator's responsibility. Take application-specific influences into account, such as:

- Blockage of plug stem
- Corrosion (destruction primarily of metals due to chemical and physical processes) \Rightarrow
- \Rightarrow Material fatigue
- Wear induced by the process medium \Rightarrow
- Abrasion (material removed by solids contained in the process medium) \Rightarrow
- \Rightarrow Medium deposits
- Aging (damage caused to organic materials, e.g. plastics or elastomer, by exposure to light and heat) \Rightarrow
- Chemical attack (organic materials, e.g. plastics or elastomer, which swell, leach out or decompose due to exposure to chemicals)

Risk of malfunction due to the use of unauthorized parts. Only use original parts to replace worn parts.

9. FUNCTION TESTING

Regularly check the safety function according to the test plan drawn up by the operator.

Record any faults in the valve and inform PFEIFFER of them in writing.

9.1 Safety-related fail-safe action

- 1. Supply the actuator with the signal pressure to allow the valve to move to the end position (completely open or closed).
- 2. Disconnect the signal pressure. This must cause the valve to move to its fail-safe position.
- 3. Check whether the valve reaches the end position within the required time.
- 4. Check whether the maximum permissible leakage is observed.

9.2 Safety-instrumented function of valve accessories

Check the safety-instrumented function of valve accessories. Refer to the associated safety manuals.

10. REPAIRS

Only perform the work on the valve described in the valve documentation.

Fail-safe action impaired due to incorrect repair.

Service and repair work must only be performed by trained staff.

11. CUSTOMER REQUEST FORM FOR SIL APPLICATIONS

Das folgende Formular hilft bei der Erfassung relevanter Information zur Erstellung der SIL-Herstellererklärung.

The following form helps to collect relevant information for SIL applications.
